THE PROBLEM

Can we hire this supplier and sign this contract?

Six months later, someone asks *why* the supplier was approved. Most companies can’t answer.

THE PROBLEM

Five checks before anyone signs

Legitimate?

Identity and good standing

Sanctioned?

On a sanctions or restriction list

DPA?

Required data-processing terms

Liability?

Terms that need Legal review

Value?

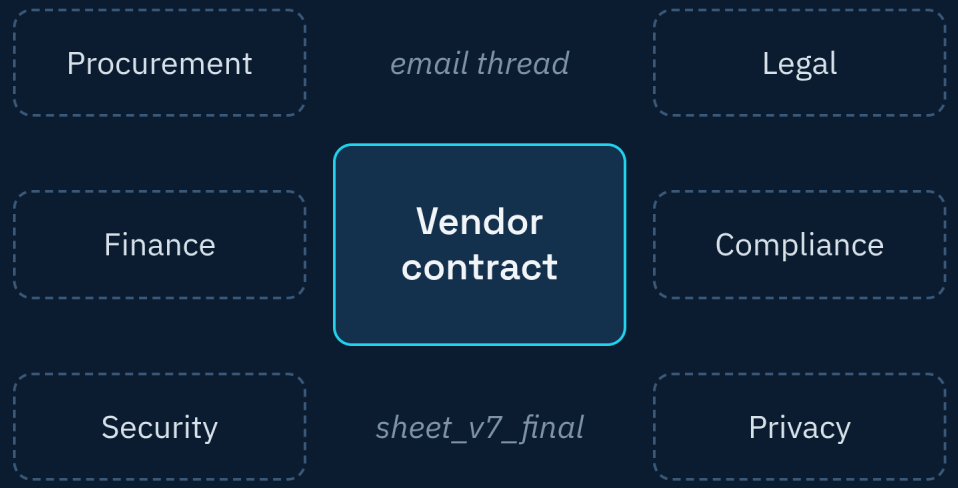

Above an approval threshold

Each check usually belongs to a different team.

THE PROBLEM

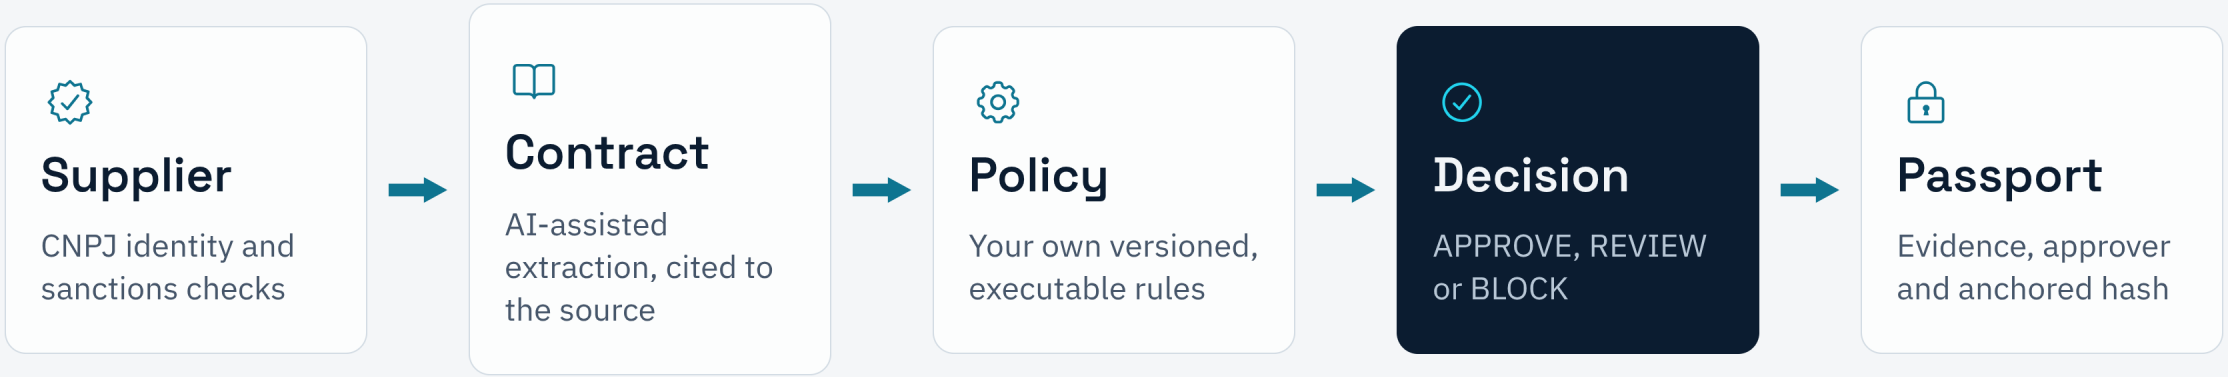

Six teams. No reproducible record.

- Checks run in email and spreadsheets
- Some get skipped or repeated
- Months later, no one can say why

THE SOLUTION

One workflow, from supplier to decision

Verify. Read. Apply your policy. Decide. Keep the evidence.

THE SOLUTION

AI reads. Your rules decide.

AI-assisted extraction

Value, term, liability, personal data, DPA. Each fact links to its source text.

Never sets the status.

Your versioned policy

Any **BLOCK** → BLOCK

Else any **REVIEW** → REVIEW

Else → **APPROVE**

REVIEW goes to a person with the right role.

Not legal advice. The customer owns its rules and its legal judgment.

DEMO · FICTIONAL COMPANIES

Acme reviews CloudDocs

Version 1

● BLOCK

R$480,000/yr, unlimited liability, personal data, no DPA. LGPD-001 blocks.

→

Version 2

● REVIEW

DPA and liability cap added. FIN-003: value still needs Legal.

→

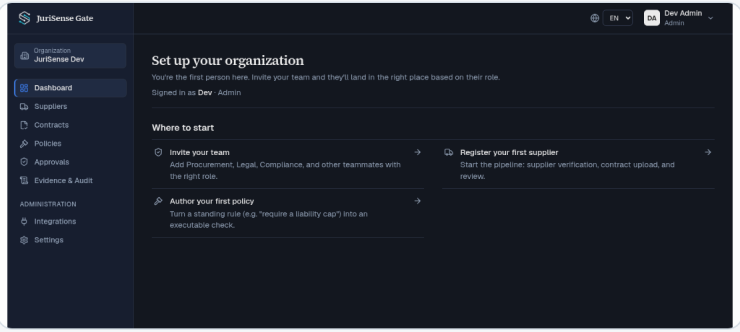

Legal approver · human review

● APPROVED

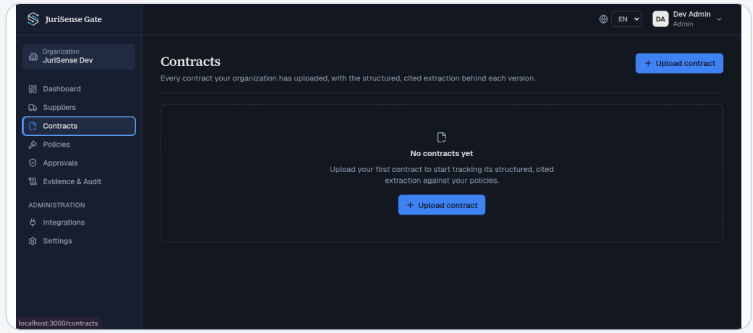

With a written rationale. Version 1 stays in the history.

THE WORKING PROTOTYPE

Fictional companies and contracts, for demonstration only.

Dashboard

Contracts

WHY NOW

Three pieces that make this practical

AI-assisted extraction

Contract text becomes structured facts, cited to the source.

Policy as code

Rules can be versioned, executed and re-run.

Verifiable evidence

A hash can be anchored and checked by a third party.

As vendor and contract volume grows, manual coordination gets harder.

WHY NOW

Law. Finance. Compliance. One decision.

Law

DPA and liability terms routed to Legal

Finance

Value thresholds that trigger approval

Compliance

Supplier checks and an audit trail

“Law. Finance. Compliance.” is the event’s stated theme.

WHY US

Built Brazil-first

CNPJ

Supplier identity and registry status

CEIS · CNEP · CEPIM

Brazilian sanctions and restriction sources

LGPD

Personal data processing requires a DPA

Starting with tech companies of ~50–1,000 people, no third-party risk tooling

Future work: more jurisdictions, continuous supplier monitoring

WHY US

Every decision is traceable

Decision Passport

Decision	**Approved after review**
Policy	**Version used, every rule result**
Evidence	**Source text, supplier checks**
Documents	**v1 and v2, with hashes**
Approver	**Legal role, rationale, audit history**

- Versioned, executable policies
- ✓ Deterministic aggregation
- Hash anchored, no raw data on-chain

Tamper-evident: it shows the evidence hasn’t changed, not that a decision is correct.

THE ASK

Help us take this beyond the hackathon

01

Examine our decision logic and evidence model

02

Give us your hardest feedback

03

Introduce us to potential early design partners

Turn contracts, supplier data, and company policies into auditable compliance decisions.
